PROFESSIONAL SUMMARY

Unity developer with **5+ years** building and operating **live mobile games** on iOS and Android. Currently a senior client engineer on **Love Eden: Chapters of Romance** (4.7★ App Store), a fully Addressables-driven live title with a 260K-line C# codebase, a weekly release train and always-on LiveOps. I own several of the game's revenue- and retention-critical systems end to end: the save and cloud-data architecture, character customization, seasonal live events, subscriptions and purchases, sign-in and account recovery, and the AI companion chat. I work across the full live-game stack: **StrangeloC / MVCS architecture**, **PlayFab** and **Firebase** backends, remote content delivery via **Unity CCD**, monetization and analytics instrumentation, and performance profiling. Comfortable owning a feature from technical design through live-ops iteration and production incident response.

TECHNICAL SKILLS

Languages & Engine	C#, Unity (2022 LTS, URP), Unreal Engine (working knowledge)
Multiplayer & Networking	Unity Netcode for GameObjects, Mirror, client-server synchronization
Architecture & Patterns	StrangeloC (MVCS), Zenject, Dependency Injection, SOLID, OOP, signal / event-driven architecture, Design Patterns (Command, Observer, Strategy, State, Factory, Object Pooling, MVC / MVVM), modular feature architecture, clean code, code review, unit testing
Content & Performance	Unity Addressables, Unity Cloud Content Delivery (CCD), multi-catalog remote content, asset-bundle deduplication, UniTask / async, Unity Profiler & Memory Profiler, cold-start optimization, IL2CPP, assembly definitions, UI & draw-call optimization, sprite atlasing, low-end Android tuning
Backend & LiveOps	PlayFab (Economy, CloudScript, Experiments), Azure Functions, Railway, Firebase (Remote Config, Analytics, Crashlytics, A/B Testing, Auth, Messaging), REST APIs, feature flagging, remote configuration, live event orchestration, save-data migration & cloud save
Monetization & Growth	Unity IAP, RevenueCat, subscriptions & battle pass, AppLovin MAX, AdMob, IronSource, Admost, Unity Ads, Facebook SDK, AppsFlyer, Amplitude, OneSignal, deferred deep linking, A/B testing, funnel & monetization analytics
Platform & Tooling	iOS & Android release management, App Store Connect, Google Play Console, TestFlight, Git / GitLab, Git LFS, Jenkins & Fastlane build pipelines, custom Unity Editor tooling, Unity Localization, Naninovel, Odin Inspector, DOTween, SRDebugger, code obfuscation, Agile / Scrum, Jira / Confluence
AI-Assisted Engineering	Daily agentic development with Claude Code & Claude Cowork; custom skills, subagents and MCP tooling; prompt engineering; AI-driven code review, refactoring and technical documentation; production LLM integration in gameplay (AI companion chat)

PROFESSIONAL EXPERIENCE

Senior Unity Developer	January 2025 – Present
United Tech (Noderno Limited) • İzmir, Türkiye	
Love Eden: Chapters of Romance, live interactive-romance game, iOS & Android • App Store • Google Play	
- Core client engineer on a live title with a 260K-line, 4,300-file Unity codebase built on StrangeloC (MVCS) with full constructor dependency injection; contributed 1,700+ commits across 18 months on a weekly release train alongside a 7-engineer team. Re-architected the save and cloud-data layer of a game that was already live, migrating every existing player without data loss. Replaced scattered persistence with a generic, strongly-typed service base that now backs 10 save domains, sharing a single serialization contract across local and cloud storage so the two can never silently diverge. - Own cloud save and account infrastructure end to end: PlayFab-backed sync with batched writes to stay inside API limits, an integrity guard that refuses to overwrite valid cloud data with empty payloads, local-save-state probing before any restore, Sign in with Apple and Google Sign-In with provider linking, and account recovery. This closed a class of reinstall and account-switch data-loss bugs in production.	

- Own the **Customization system** end to end: appearance progression, prefab variants, ScriptableObject content databases and its addressable asset pipeline. It is the game's most heavily iterated feature surface.
- Built and operate the **LiveOps event framework** behind every seasonal campaign (Halloween, Christmas, Valentine's, Black Friday, Summer): a reusable calendar, mission and reward architecture with remote-configured content, so new themed events ship **without a client release**.
- Architected a new **premium character system** end to end: its own scene and content pipeline, relationship progression, monetization hooks and analytics, and authored the internal developer guide the team builds against.
- Designed the game-wide **popup and notification queue**: priority-based scheduling with filter and display-strategy pipelines, animation-aware auto-close and safe teardown. Adopted project-wide and documented for the team.
- Shipped **monetization features**: subscription tiers, battle pass, first-purchase and non-payer offers, virtual-currency store and transaction flows, and **AppLovin MAX** ads, all instrumented for experimentation via PlayFab Experiments and Firebase Remote Config.
- Cut download size and memory pressure by introducing a **shared-dependency Addressables group** that eliminated duplicated assets across bundles, in a fully addressable content pipeline delivered over **Unity CCD** with multi-catalog, on-demand updates.
- Delivered the **LLM-powered AI companion chat**: per-character prompt and personality configuration, conversation memory, streamed response handling with cancellation, subscription paywall gating, and an in-chat moderation and reporting flow. Generative AI shipped into a production game with real users.
- Extended the **Naninovel** narrative engine with custom commands, chat-style text printers, choice handlers and remote script syncing to support a chat-first storytelling UX.
- Built growth and retention features: a **deferred deep-link architecture** (AppsFlyer OneLink + custom URI fallback) routing attributed campaign traffic to targeted in-game content, plus daily quests, achievements, challenges, relationship progression, push campaigns and the in-game notification system, all instrumented with Firebase, Amplitude and AppsFlyer.
- Diagnose and resolve **live production incidents** on a weekly cadence: loading-flow stalls, purchase and subscription state desync, save-corruption recovery and platform login regressions, sustaining a **4.7★** store rating through 25+ releases.

Game Developer

March 2021 – October 2024

Veloxia Technology · İzmir, Türkiye

Casual & idle mobile games, iOS & Android, 5 shipped titles

- Shipped and live-operated **five casual and idle mobile titles** from prototype through post-launch, owning gameplay features, UI/UX flows and content pipelines on both platforms.
- Designed and integrated **event-driven live content systems** (Halloween, Christmas, Wheel of Fortune and recurring reward events), giving the team a repeatable pattern for seasonal monetization.
- Owned the full **monetization and analytics stack**: Unity IAP and RevenueCat subscriptions, ad mediation across AdMob, AppLovin, IronSource, Admost and Unity Ads, Facebook SDK, Firebase (Analytics, Crashlytics, Remote Config, A/B Testing) and OneSignal push notifications.
- Migrated content delivery to **Unity Addressables** and refactored a large legacy codebase onto **Zenject** dependency injection and SOLID principles, improving load times, memory footprint and testability, while profiling and optimizing runtime performance and draw calls on low-end Android devices.

SHIPPED TITLES (iOS & Android)

Love Eden: Chapters of Romance	Narrative-driven live game, United Tech, 2025–present
Shipping Life: Idle Empire	Idle tycoon, Veloxia Technology
Space Colony: Idle Tap Miner	Idle clicker, Veloxia Technology
Match Monsters!	Casual match puzzle, Veloxia Technology
Money Dash: Idle Banking Game	Idle simulation, Veloxia Technology
Market Master: Idle Shopping	Idle simulation, Veloxia Technology

EDUCATION

B.Sc. Software Engineering, Yaşar University, İzmir	2020
Associate Degree, Computer Programming, Ege University, İzmir	2014

ADDITIONAL

Languages	Turkish (Native) • English (B2, professional working proficiency, fully remote-team capable)
Military Service	Completed • Work Preference: Open to remote, hybrid and relocation across EU / UK / Türkiye
