Senior Unity Developer • Live Mobile Games

İzmir, Türkiye (Open to Remote & Relocation) | emrecanakli@gmail.com | [linkedin.com/in/ecanakli](https://www.linkedin.com/in/ecanakli)

PORTFOLIO [ecanakli.github.io](https://github.com/ecanakli)

Shipped titles, system case studies and technical write-ups

PROFESSIONAL SUMMARY

Unity developer with **5+ years** building and operating **live mobile games** on iOS and Android. Most recently senior client engineer on **Love Eden: Chapters of Romance** (4.7 ★ App Store, 100K+ Google Play installs), a fully Addressables-driven live title with a 260K-line C# codebase, a weekly release train and always-on LiveOps. I owned several of the game's revenue- and retention-critical systems end to end: the save and cloud-data architecture, character customization, seasonal live events, subscriptions and purchases, sign-in and account recovery, and the AI companion chat. I work across the full live-game stack: **StrangeloC / MVCS** architecture, **PlayFab** and **Firebase** backends, remote content delivery via **Unity CCD**, monetization and analytics instrumentation, and performance profiling. Comfortable owning a feature from technical design through live-ops iteration and production incident response.

TECHNICAL SKILLS

Languages & Engine	C#, Unity (2022 LTS, Unity 6, URP), Shader Graph, Unreal Engine (working knowledge)
Performance & Optimization	Unity Profiler & Memory Profiler, Frame Debugger, draw call and batch reduction, SRP Batcher and GPU instancing, sprite atlasing, Canvas and UI rebuild cost, GC allocation elimination, object pooling, texture compression (ASTC / ETC2), LOD and occlusion culling, cold-start optimization, IL2CPP and managed stripping, assembly definitions, build size reduction, low-end Android tuning
Architecture & Patterns	StrangeloC (MVCS), Zenject, Dependency Injection, SOLID, OOP, signal / event-driven architecture, Design Patterns (Command, Observer, Strategy, State, Factory, Object Pooling, MVC / MVVM), modular feature architecture, clean code, code review, unit testing
Content Delivery	Unity Addressables, Unity Cloud Content Delivery (CCD), multi-catalog remote content, asset-bundle deduplication, UniTask / async
Backend & LiveOps	PlayFab (Economy, CloudScript, Experiments), Azure Functions, Railway, Firebase (Remote Config, Analytics, Crashlytics, A/B Testing, Auth, Messaging), REST APIs, feature flagging, remote configuration, live event orchestration, save-data migration & cloud save
Monetization & Growth	Unity IAP, RevenueCat, subscriptions & battle pass, AppLovin MAX, AdMob, IronSource, Admost, Unity Ads, Facebook SDK, AppsFlyer, Amplitude, OneSignal, deferred deep linking, A/B testing, funnel & monetization analytics
Multiplayer & Networking	Unity Netcode for GameObjects, Mirror, client-server synchronization
Platform & Tooling	iOS & Android release management, App Store Connect, Google Play Console, TestFlight, Git / GitLab, Git LFS, Jenkins & Fastlane build pipelines, custom Unity Editor tooling, Unity Localization, Naninovel, Odin Inspector, DOTween, SRDebugger, code obfuscation, Agile / Scrum, Jira / Confluence
AI-Assisted Engineering	Daily agentic development with Claude Code & Claude Cowork; custom skills, subagents and MCP tooling; prompt engineering; AI-driven code review, refactoring and technical documentation; production LLM integration in gameplay (AI companion chat)

PROFESSIONAL EXPERIENCE

Senior Unity Developer

United Tech (Noderno Limited) • İzmir, Türkiye

January 2025 – September 2026

Love Eden: Chapters of Romance, live interactive-romance game, iOS & Android

- Core client engineer on a live title with a **260K-line, 4,300-file Unity codebase** built on **StrangeloC (MVCS)** with full constructor dependency injection, shipping on a weekly release train alongside a 7-engineer team.
- Re-architected the save and cloud-data layer of a game that was already live, migrating every existing player without data loss.** Replaced scattered persistence with a generic, strongly-typed service base now backing **11 save services** on a single serialization contract across local and cloud storage. Consolidated the player profile from **17 cloud keys into 1**, replaced a 10-second periodic upload for all users with session-based sync for authenticated users only, and cut save latency from **500–2000ms to 100–300ms with 85%+ fewer API calls**.
- Designed **versioned cloud writes** (write counter plus writer identity per service) so a stale device cannot overwrite newer progress, within PlayFab's hard **10-key write limit**. Using those counters, diagnosed and fixed a **production data-loss bug that had silently stopped cloud saving for every player who reinstalled the app**; affected devices self-recover on the fixed build with no migration or support action.
- Rebuilt **login and multi-account support**. The game held one backend account per device, so signing in with a second email copied that account's data over the current one and deleted story progress. Delivered genuine account switching (on-disk switch record, in-place restart, side-by-side account comparison), plus **Sign in with Apple, Google Sign-In**, provider linking and account recovery, closing six further login defects including data written into the wrong account on sign-in.

- Owned the **Customization system** end to end, the game's most heavily iterated feature surface and its only self-directed spend: five avatar slots across gendered ScriptableObject catalogs, three entry flows on one screen (profile, onboarding, pre-date), and three revenue paths (gem pricing with a multi-item cart, rewarded-ad unlocks, and real-money themed clothing sets). Bounded its memory cost by splitting each option into independently loaded character and menu sprites and releasing onboarding content when first-run ends, and removed a dead runtime colour system, documenting the content-planning consequence for the team.
- Built the **LiveOps Wardrobe** sales system: themed sets sold as a single IAP during an event, modelled as a sales wrapper so purchased pieces enter the normal owned-items list and behave like any other item; finished events stay purchasable and come off sale once fully owned, with the funnel instrumented end to end.
- Delivered the **engagement and retention systems** as data-driven content rather than code: multi-level achievements and a daily quest / streak loop (targets, rewards and analytics keys are authored assets, claimed through the standard gem transaction path behind an in-flight guard against double claims), and the **After Hours** progression-gated content track, extensible by authoring alone with a monotonic state model that self-heals on render when a live trigger is missed.
- Built the **in-game mailbox and CRM surfaces**: dashboard-authored messages whose tab derives from their type, targeted on platform, app version, build, **spending segment** and per-character match state; plus an email-consent flow handling Apple private-relay addresses, with four remotely configured, A/B-testable rules against prompt fatigue.
- Built and operated the **LiveOps event framework** behind every seasonal campaign (Halloween, Christmas, Valentine's, Black Friday, Summer): a reusable calendar, mission and reward architecture with remote-configured content, so new themed events ship **without a client release**.
- Architected a new **premium character system** end to end: its own scene and content pipeline, relationship progression, monetization hooks and analytics, and authored the internal developer guide the team builds against.
- Designed the game-wide **popup, banner and sidebar systems** that decide what reaches the player and in what order: a session-start sequence chosen from player age and session count, a filter chain running **before** a popup is constructed (A/B variant suppression and flagged-account blocking), inspector-configured ordering, animation-aware auto-close and safe teardown. Adopted project-wide and documented for the team.
- Cut cold start, download size and memory pressure across a fully addressable pipeline delivered over **Unity CCD** with multi-catalog on-demand updates: split a **7,140-entry** content graph into four catalog domains behind a **137-entry (~200KB) boot catalog**, and introduced a **shared-dependency Addressables group** that eliminated assets duplicated across bundles.
- Shipped **monetization features**: subscription tiers, battle pass, first-purchase and non-payer offers, virtual-currency store and transaction flows, and **AppLovin MAX** ads, all instrumented for experimentation via PlayFab Experiments and Firebase Remote Config.
- Delivered the **LLM-powered AI companion chat**: per-character prompt and personality configuration, conversation memory, streamed response handling with cancellation, subscription paywall gating, and an in-chat moderation and reporting flow. Generative AI shipped into a production game with real users.
- Extended the **Naninovel** narrative engine with custom commands, chat-style text printers, choice handlers and remote script syncing to support a chat-first storytelling UX.
- Built a **deferred deep-link architecture** (AppsFlyer OneLink + custom URI fallback) routing attributed campaign traffic to targeted in-game content, alongside relationship progression, push campaigns and the in-game notification system, all instrumented with Firebase, Amplitude and AppsFlyer.
- Diagnosed and resolved **live production incidents** on a weekly cadence: loading-flow stalls, purchase and subscription state desync, save-corruption recovery and platform login regressions, sustaining a **4.7★** store rating through 25+ releases.

Game Developer

Veloxia Technology · İzmir, Türkiye

March 2021 – October 2024

Casual & idle mobile games, iOS & Android · Shipping Life: Idle Empire · Space Colony: Idle Tap Miner · Match Monsters! · Money Dash: Idle Banking Game · Market Master: Idle Shopping

- Shipped and live-operated **five casual and idle mobile titles** from prototype through post-launch, owning gameplay features, UI/UX flows and content pipelines on both platforms in Unity 2D and 3D.
- Designed and integrated **event-driven live content systems** (Halloween, Christmas, Wheel of Fortune and recurring reward events), giving the team a repeatable pattern for seasonal monetization.
- Owned the full **monetization and analytics stack**: Unity IAP and RevenueCat subscriptions, ad mediation across AdMob, AppLovin, IronSource, Admost and Unity Ads, Facebook SDK, Firebase (Analytics, Crashlytics, Remote Config, A/B Testing) and OneSignal push notifications.
- Migrated content delivery to **Unity Addressables** and refactored a large legacy codebase onto **Zenject dependency injection** and SOLID principles, improving load times, memory footprint and testability.
- Profiled and optimized runtime performance with the **Unity Profiler**: reduced draw calls and batches, cut GC allocations, atlased sprites and tuned memory for low-end Android devices.

EDUCATION

B.Sc. Software Engineering	Yaşar University, İzmir, 2020
Associate Degree	Computer Programming, Ege University, İzmir, 2014

ADDITIONAL

Languages: Turkish (Native) · English (B2, professional working proficiency, fully remote-team capable). **Military service** completed. **Open** to remote, hybrid and relocation across EU / UK / Türkiye.
